

THOMSON REUTERS

ENHANCING ESSENTIAL SCIENCE INDICATORS FOR A MORE COMPREHENSIVE AND ACCURATE UNDERSTANDING OF SCHOLARLY RESEARCH

AUTHORS: SIMON PRATT, JENNIFER MINNICK AND JOEL FRANKE
LAST UPDATE: APRIL 7, 2014

THOMSON REUTERS™

INTRODUCTION:

The Essential Science IndicatorsSM (ESI) was first established in 2001 and since then has become a vital tool for many universities, governments and funding bodies globally. The fast-breaking metrics and indicators in ESI are now placed in more context with the launch of InCites: Essential Science Indicators.

Essential Science Indicators is a comprehensive compilation of science performance statistics and science trends data based on journal article publication counts and citation data from Thomson Reuters databases. ESI is an ideal analytical resource for policymakers, administrators, analysts and information specialists in government agencies, universities, corporations, private laboratories, publishing companies and foundations, as well as members of the scientific press and recruiters. Use ESI to highlight the emerging and impactful papers, people, and groups that should be watched. Report on long-term outcomes and benchmarks to gain a more thorough understanding of the influence institutional work is having in both cutting-edge and long-term scholarly trends. Analysts and researchers can easily assess and report on research activities and make comparisons to peers to create policies and programs that highlight success. Spot emerging trends, promote the achievements of the most influential researchers and identify when shifts in strategy are needed.

Because of its long history and dedicated user group, stability of both the data and features of the interface have become important. During the lifetime of ESI, Thomson Reuters has had to delicately balance the need for stability with the changing needs of users and enhancements to Thomson Reuters' systems regarding data processing. Beginning with the first bimonthly update to ESI, in early 2014, Thomson Reuters has taken some significant steps to build out and refine Web of Science™ data processing to enable the future development of ESI. This document outlines the changes to the data and the value that these changes bring.

ENHANCED DATA PROCESSING

One of the most significant process changes has been the switching of the Thomson Reuters ESI data production from legacy systems to our current in-house state-of-the-art data processing system which relies on the same data structure as the Web of Science—processed and source data are therefore synchronised. Benefits because of this change include:

- Updates to ESI have a shorter processing time.
- Updates to ESI will continue to occur every two months, which gives an appropriate period of stability between updates, but the time taken to prepare each update is now approximately four weeks shorter and will therefore present a more current view of the data as outlined below.
- ESI is more closely synchronized to the original source and other services.
- The data in ESI, and other services on the InCites™ platform, are now more closely synchronised to the Web of Science. This will include the most recently published documents and citation counts. Note that some discrepancies may still occur because of differences in the update frequency.
- Data corrections are now displayed in ESI automatically.

"ANALYSTS AND RESEARCHERS CAN EASILY ASSESS AND REPORT ON RESEARCH ACTIVITIES AND MAKE COMPARISONS TO PEERS TO CREATE POLICIES AND PROGRAMS THAT HIGHLIGHT SUCCESS. SPOT EMERGING TRENDS, PROMOTE THE ACHIEVEMENTS OF THE MOST INFLUENTIAL RESEARCHERS AND IDENTIFY WHEN SHIFTS IN STRATEGY ARE NEEDED."

Use of publication date

With the first update in 2014, the 'year' that is utilized for searching, filtering and counts of records for graphs and tables is now based on the publication date of the journal, this is the date listed on the cover of that issue of the journal. Previously ESI used the date in that the issue was indexed by Thomson Reuters. This change has been one of the most frequently requested changes by ESI users and we are very pleased to introduce it. There are a number of benefits because of this change:

- **The use of the publication date is more transparent.**
One can see the correlation with the date used for the search, filter and aggregations and the date listed on the article/issue.
- **Year on year comparisons and trend analysis of document counts are more consistent.**
Occasionally there can be lag times in the Thomson Reuters indexing process at the beginning and end of each year which may artificially inflate or deflate the total number of papers indexed during that year. By utilizing the published date instead of the date the document was indexed there is a more consistent representation of the published year. However, the published date as listed by the journal can be different to the actual date of publication. There will be cases where journal issues from the one year are published and indexed well into the next year. This publisher policy may cause complications when accessing ESI at the beginning of each year as data for the preceding year may be incomplete. As journal issues are published and processed, subsequent updates to ESI will display a more complete total for the preceding year.

Institutional name affiliation

When affiliating papers to institutions it is important that all the name variants are unified for a comprehensive view of the research output. With the first data update of 2014 enhancements to the name unification process have been implemented. This is a significant improvement, as previous name unifications relied on a separate and less comprehensive unification process. Advantages that have been introduced because of this change include:

- **Name unifications are consistent across Thomson Reuters services including the Web of Science "Organization Enhanced".**
In addition to consistency across services such as the Web of Science and InCites, the full list of affiliated organizations and name variants is available in the Web of Science making the process very transparent.
- **Corrections to name unifications are simplified.**
Thomson Reuters make stringent efforts to collate accurate affiliation information, but research organizations are very complex and there can be name changes over time. It is now very simple to request a change to unification via our Customer Technical Support desk.
- **Inclusion of university systems and changes to government organizations.**
Previously, it may not have always been clear if a particular entry was an independent university or part of a larger university system. As the enhancements described above were introduced, considerable efforts were made to clarify the relationship between independent universities and university systems.

Similarly the unifications for several governmental research organizations such as the National Institutes of Health have been enhanced. The universities in university systems and individual institutes of government organizations will also be included if they independently meet the ESI threshold for inclusion. The addition of these entities is a valuable enhancement and allows users to better compare themselves to their peers and umbrella organizations in a more accurate and transparent way. However, the addition of entities may lead to confusion when comparing to the previous editions of ESI. For example when viewing a sorted list of results, the relative position of some institutions may have moved as a result of new entities being added higher up the list rather than a drop in performance.

- **In the future it will be possible to filter on organization type.**

Our enhanced index of affiliations includes information about organization types, such as university systems, universities, government research organizations and so forth. In future versions of ESI it will be possible to limit your analysis, including sorted lists, only to specific organization types.

Changes to field assignments

The 22 different research fields in ESI are generated by assigning journals to each of the fields. Academic research domains evolve over time and journals may shift their subject focus, it is therefore necessary to periodically review and change the journal assignments. With the first update in 2014 Thomson Reuters has modified the journal assignments to make a more accurate representation of those fields. The details of the changes are listed in the Appendix. These changes impact approximately 10% of the journal titles.

Change to the algorithm for the re-classification of articles in multidisciplinary journals

Papers published in multidisciplinary journals such as Science and Nature typically cover a variety of different topics. For all "Multidisciplinary" journals we use an algorithmic approach to reassign individual papers to one of the other 21 fields. When it is not possible to make a reassignment the articles are left as "Multidisciplinary".

Previously the reassignment algorithm utilized the fields of the cited references and citing articles to determine the correct field. With this update only the fields of cited references are used. The benefit of this change in methodology is that papers will only be reassigned once and the field will not change over time. Additionally, other Thomson Reuters services on the InCites platform use the same approach for re-assignment and therefore there is greater consistency across the platform.

New functionality

Note that the following features relating to the changes in the data are only available on InCites: Essential Science Indicators which also contains many other enhancements and benefits.

- **Search within countries**

With the addition of the enhanced affiliation information, it is now possible to filter results to institutions within a specific country, this was a frequently requested enhancement and we are very pleased to be able to include it.

- **Geographical representation of data in maps**

Country data in ESI will be displayed as a shaded map of the world which facilitates data interpretation and comparison

- **Exportable data**

Data from reports can now be easily saved or exported in a variety of formats.

- **Baselines and thresholds are readily available**

The average citation rates, percentiles, field rankings and thresholds for inclusion in ESI, Highly Cited Papers and Hot Papers are all full disclosed in one location. This makes the data very transparent and easy to understand.

ABOUT INCITES: ESSENTIAL SCIENCE INDICATORS

Now part of the InCites platform, InCites: Essential Science IndicatorsSM can determine the influential individuals, institutions, papers, publications, and countries in a field of study – as well as emerging research areas that could impact work.

Conduct ongoing, quantitative analyses of research performance and trends in science. Rank top scientists, institutions, countries, and journals in 22 specific fields of research in science performance statistics and science trends based on journal article publication counts and citation data.

Essential Science Indicators is the ideal resource for conducting complex analyses of scientific literature to discover the information needed to:

- Analyze research performance of companies, institutions, nations, and journals.
- Identify significant trends in the sciences and social sciences.
- Rank top countries, journals, scientists, papers, and institutions by field of research.
- Determine research output and impact in specific fields of research.
- Evaluate potential employees, collaborators, reviewers, and peers.
